

Persist logged user between sessions.
At the first succesful login a token is created and added to PersistentSession table along with the expires field wich is actual datetime + 2hours and to \$Cookie->email, \$Cookie->token. When trying to access the page again we compare token and id_user from database with those presented in the \$Cookie, if succesful we change the "expires" field from PersistentSession table to actual datetime + 2hours again.

Pictures		
id_picture	int	
id_user_owner	int
